

BEACONSFIELD PARK SYNTHETIC TURF FIELD

Concept Plan

Park Board Committee Meeting
Monday, March 30, 2026

- The purpose of this presentation is:
 - To provide a summary of information on the proposed Beaconsfield Park Synthetic Turf Field project, which spans several years.
 - To share findings from the recent feasibility study that indicates that a regulation size synthetic turf soccer field is possible
 - To seek a Board decision on the proposed concept plan to advance the project to the detailed design phase.

 PARK LOCATION

 PARK BOUNDARY

- Beaconsfield Park gravel field considered potential synthetic turf field site since 2009 with community engagement in 2018 indicating positive support
- Sport Field Strategy (SFS) included 3 rounds of public engagement:
 - 3rd round gathered feedback on 'Big Move' 2: *Convert select all weather (gravel) fields to synthetic turf fields including Beaconsfield*
- Beaconsfield was identified third in the SFS's approved sequencing plan for Big Move 2
- July 7, 2025, Board motion and September 17, 2025, Council motion directs staff to prioritize the project within the 2027-2030 Capital Plan

12

THE "BIG MOVES"

THERE ARE FIVE "BIG MOVES":

1. Renew existing synthetic turf fields
2. Convert select all weather (gravel) fields to synthetic turf fields
3. Create hub sites
4. Establish dedicated ball diamond and rectangular field parks
5. Establish sport-specific priority fields

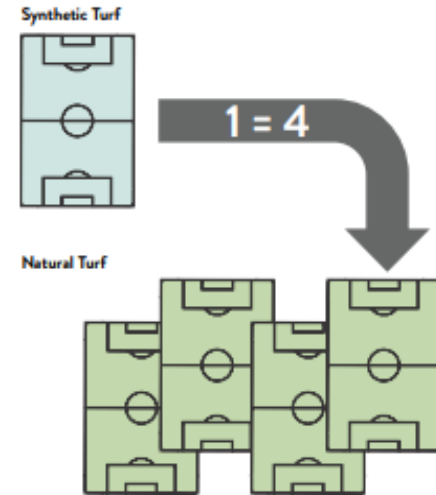

Synthetic Turf vs Natural Turf: Comparison

Considerations	Synthetic Turf	Natural Turf (Class A - B)
Service Levels & Utilization	• High, year-round capacity that supports high-intensity • ~3,000 permitted hours/year (equivalent to 4 Class A sports fields) • Resilient under high use and wet conditions	• Capacity limited by seasonal conditions, turf recovery - not intended for continuous, high-intensity use • ~300–600 permitted hours/year depending on Class • Higher risk of surface deterioration
Cost Considerations	• Higher upfront capital cost (\$\$\$\$) • Recovers more than 100% of expenses through revenue	• Lower upfront capital cost (\$-\$\$\$\$) • Recovers 8-10% of expenses through revenue (Ongoing maintenance costs not fully recoverable)
Operations & Maintenance Inputs	• Require low-to-moderate, specialized maintenance (grooming, infill replacement) • Can accommodate continuous use	• Require high, consistent maintenance (mowing, watering, fertilizing, aerating) • Need rest between games to manage wear.

Synthetic Turf vs Natural Turf: Key Considerations

- **Challenge of comparing costs:** Capital cost alone is misleading because while syn. turf has a higher upfront cost, it supports significantly higher use, which directly influences revenue potential and cost recovery.
- **Park provision:** Because synthetic turf fields accommodate more use at a single field, there is an opportunity to free up scarce, valuable space in the park system for other park uses.
- **Growth Area:** Effective rest and recovery of natural turf fields is difficult in high-density areas. Limiting informal use requires a level of enforcement that is not feasible, and fencing is not a preferred solution due to unintended uses (i.e. dogs)
- The Sport Field Strategy's **Environmental and Human Health Report** includes further information and comparison between natural and synthetic turf fields.

**1 SYNTHETIC TURF = 4+ NATURAL TURF FIELDS
IN BOOKABLE HOURS OF PLAY**

Feasibility Study – Key Findings

■ Site Fit Investigation

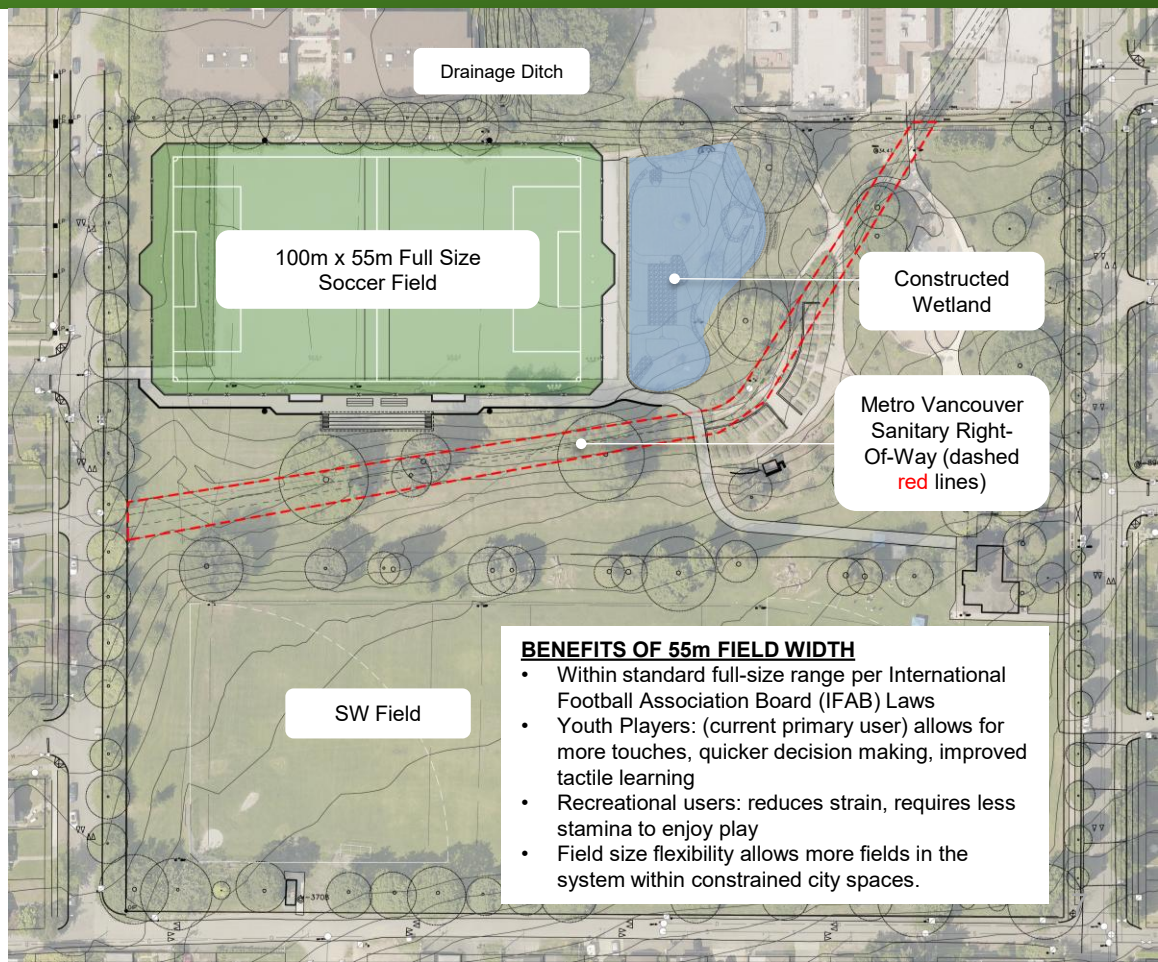

- Constrained site
- Accommodates regulation field dimensions
- SW field investigated

■ Ground Conditions

- High groundwater and limited infiltration capacity

■ Environmental Considerations

- Close proximity to constructed wetland and drainage ditch
- Appropriate material selection and physical interventions required to avoid impacts

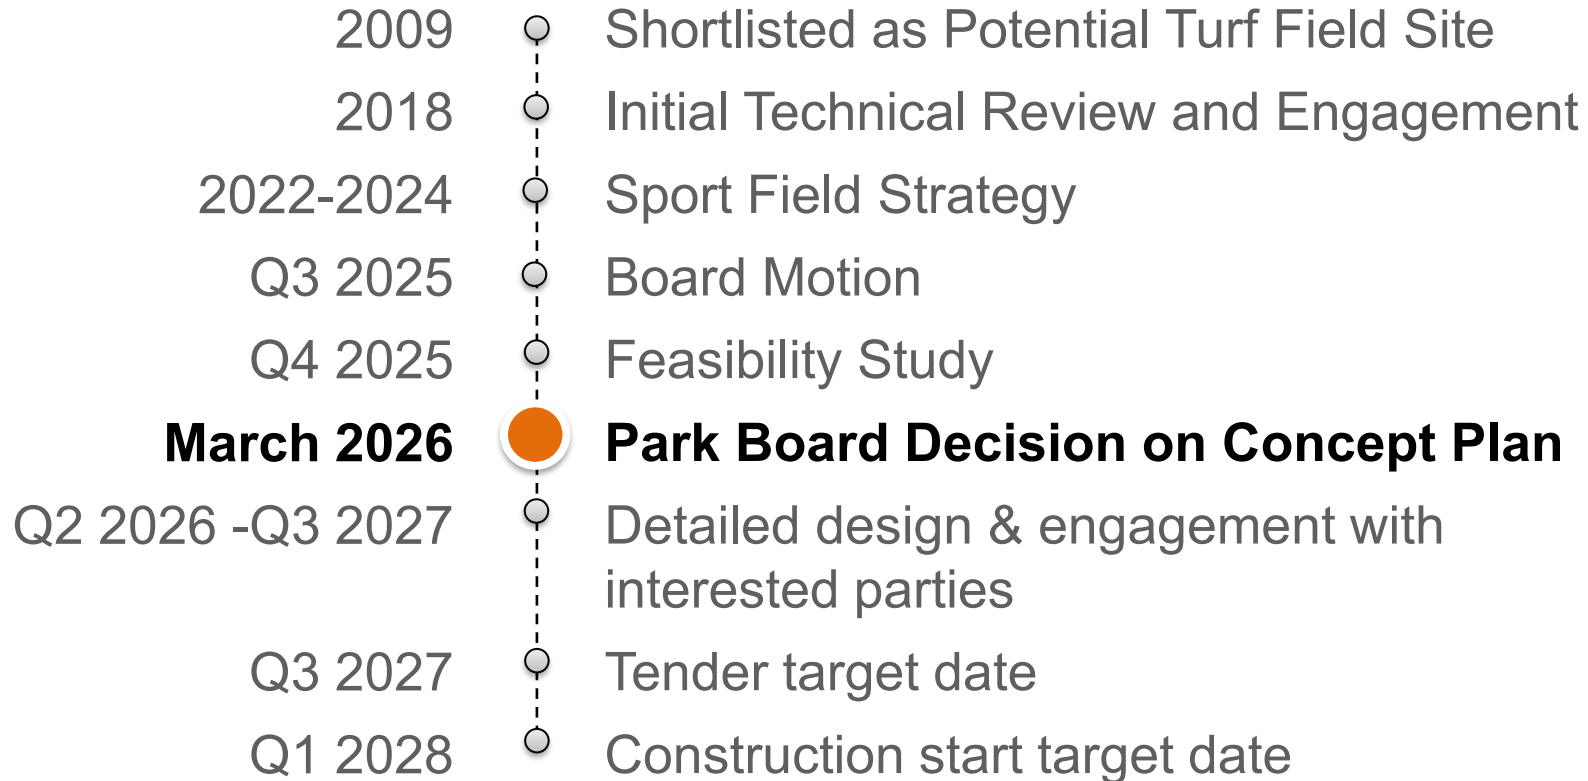

Concept Plan

- New, lit synthetic turf field replaces the existing all-weather gravel field
- Increases capacity to help meet the rising demand for year-round, high-quality playing surfaces
- Well-positioned site to accommodate increase in activity, close to Van Tech Syn Turf Field and Renfrew Skytrain Station
- Environmental impacts mitigation measures a key project component

- The total anticipated project costs based on 'Order of Magnitude' construction estimate and including soft costs, project management fees, permitting, escalation and contingencies is \$9.8M funded from the 2023-2026 and 2027-2030 Capital Plans, subject to prioritization within and approval of the 2027-2030 Capital Plan
- Potential partnership funding is to be determined and subject to fundraising and partnership agreements. Any partner funding would contribute towards amenities not covered in the base scope estimated above
- Estimated annual operating impact to capital budget is \$0.25M, including \$0.06M for synthetic turf operations.

- A. THAT the Vancouver Park Board approve the proposed concept plan for the Beaconsfield Park – Synthetic Turf Field as described in this report and shown in Appendix A;
- B. THAT staff continue to work with interested parties and partner groups through detailed design to confirm project details, cost-sharing or private contributions; and
- C. THAT the Board direct staff to share this report with Mayor & Council, for information, in relation the Council motion approved on September 17, 2025, titled “Accelerating the Turf Field Upgrade at Beaconsfield Park for Inclusion in the 2027-2030 Capital Plan”

Questions and Comments
